

Could a wasm port of this routine win?

A wasm port must copy its input in and its result back out, so it can never beat the grey dot: that dot is the port with its compute taken to zero — grey right of blue means it cannot win. Only BGZF inflate is ported, and its triangle is the real measurement. The number is blue ÷ grey.

- best case for a wasm port — its copying, with the compute free
- JavaScript today
- ▲ the one wasm port that exists, measured
