

— Release 2.4.0 — This work — GenomeSpy 0.85.0 — the wait --- the drawing
— Release 4.3.0 — igv.js 3.8.5

2× zoom in, median of five steps, on one instrument belonging to neither tool. No arm made a network request on any step, so every difference here is drawing and not fetching. Solid is the wait; dashed is the drawing inside it. igv.js's two lines coincide — its wait is its redraw — while this work spends half a second in a navigation debounce around 0.6 ms of drawing. The two older builds have no dashed line: they rasterize in a worker, where a page-side clock times the compositing blit and not the rendering.
