

Median step of five, median of three interleaved rounds, against an application already up.

Left: navigation to the last draw before the page stops drawing and stops fetching; for a pan, over the steps on which the tool fetched. Right: the drawing inside that, timed at the canvas API.

A JBrowse zoom waits out a 500 ms debounce it does not spend drawing, so read the pair, not a column.

The releases rasterize in a worker, where the draw clock cannot see them, so the right column omits them.

Release 2.4.0   Release 4.3.0   This work   igv.js 3.8.5
