

— Release 2.4.0
 — Release 4.3.0
 — This work
 — igv.js 3.8.5
 — the wait
 --- the drawing

short read

long read

2x zoom in, median of five steps, on one instrument belonging to neither tool. No arm made a network request on any step, so every difference here is drawing and not fetching. Solid is the wait; dashed is the drawing inside it. igv.js's two lines coincide — its wait is its redraw — while this work spends half a second in a navigation debounce around 0.6 ms of drawing. The two older builds have no dashed line: they rasterize in a worker, where a page-side clock times the compositing blit and not the rendering.
