

Could a wasm port of this routine win?

A wasm port has to copy its input into wasm memory and its result back out.

Grey is that copying alone, nothing computed. Every real port pays it on top of its own work, so none can land left of grey. Where grey is right of blue, no port can beat today's JavaScript.

Only BGZF inflate has a real port; the triangle is it. The number is blue ÷ grey.

- just the copying, with nothing computed
- the whole job today, in JavaScript
- ▲ the one real wasm port, measured
